

Пример использования REST интерфейса на языке Python

Пример использования класса

```
from prostor-sms import Gate

    sender = Gate('your_login', 'your_password');

    print sender.credits() # узнаем текущий баланс
    print sender.senders() # получаем список доступных подписей
    print sender.send('71234567890', 'some text here', 'prostor-sms')
#отправляем sms
    print sender.status(12345)
```

Класс Gate

```
import urllib2
import urllib
import base64
import sys

class Gate:
    """Class for using prostor-sms service via GET requests"""

    __host = 'gate.prostor-sms.ru'

    def __init__(self, api_login, api_password):
        self.login = api_login
        self.password = api_password
